1. Open Terminal and create the environment

```
conda create --name petrophysics python=3.11 pip -y
```

Activate it:

```
conda activate petrophysics
python -m pip install --upgrade pip
```

2. Install the required packages

conda config --add channels conda-forge

```
python -m pip install numpy pandas scipy matplotlib PyQt6
nptdms jupyterlab notebook ipykernel
```

3. Register the environment in Jupyter

```
python -m ipykernel install --user --name petrophysics --
display-name "Python (Petrophysics UCS)"
```

4. Verify the installation

Copy and run this complete command:

```
python -c "import numpy, pandas, scipy, matplotlib, nptdms;
from PyQt6 import QtWidgets; print('Petrophysics environment
installed correctly')"
```

The expected output is:

```
Petrophysics environment installed correctly
```

5. Start JupyterLab

Move into the folder containing the codes:

```
cd "/path/to/your/Petrophysics course"
```

Then start JupyterLab:

```
jupyter lab
```

In each notebook, select:

`Kernel → Change Kernel → Python (Petrophysics UCS)`
